A XML-based file format, called ACE, is designed to facilitate exchange of information between applications. The format is used to exchange vector drawing data between AutoCAD and its competitors. The standard and command line interfaces to the ACE format are available from Autodesk. ACE is supported by most CAD applications, including some from other software companies. A procedure is described for the determination of antimony and arsenic in river and seawater, with arsenic and antimony being determined simultaneously in the same procedure. The procedure, which is based on the anion exchange method, has been successfully applied to the analysis of total As, As(III), As(V), Sb and Sb(V) in river and seawater. The method involves no intermediate steps and a procedure with the concentration of the species which are to be determined is carried out only once, enabling subsequent speciation and determination of the other species.Physical activity and risk of metabolic syndrome and type 2 diabetes: the SEARCH study. Markups from popular services such as Chaganty and other add-ons are supported. It's also easy to customize these markups by using the text tools or select style customization. Markup Handling: Do not attach ("lock") the markup while you are working with the drawing (for example, while you select geometry), even when zoomed out. Instead, quickly work with the drawing, while the marking is automatically updated to reflect the current drawing state. Removing the previously attached markup is simple. Simply go to the Markup Manage tool and select the new option to remove the marking. Markup creation now supports three modes. The Draft mode is used for quick markup creation and use. You can quickly create a marking without the complicated setup. The Insert mode can be used for more complex marking creation. This mode provides more control over the create process, like editing the text styles, checking and rechecking the settings. Refresh Markup: Automatically apply ("refresh") the markups to the drawing for the most accurate results. Point Cloud Support: Point cloud objects now show the edge segments. Previously the edge segment information was shown only for the last segment (and only when dragging the object). See also: Also in AutoCAD 2023, we've made a number of improvements to the many annotation tools. For example, you can now collapse annotations. And when creating an annotation, you can now quickly select an object type (line, polyline, curve, ...). Line Annotations: Line annotations are now easier to create. The text box is simply selected from the line annotation drop-down list. Also, there are now three new text styles. These three styles provide access to a lot of common line annotation features and editing tools. New Line Annotations Text Styles: Text underline (cornerline). This text style shows a line and its edge segment(s). The cornerline can be turned on or off. Text inside the line (inside cornerline). This text style shows only the text inside the line. There are three additional text styles: Text boxes. A box with a rounded corner and a line in the center. (Video: 2:30 min.) (text box image) Font size. Small or large text in the text box. Line width. Large
