The following instruction has been a part of the assembly for a while. Does anyone know if the following instruction can be replaced with a NOP without changing the behavior of the assembly code? If so, why is the byte not used? A: There's no reason to replace it with a NOP. It's not part of a transfer instruction and serves no purpose. The format of the instruction is still unique, so if a new form of it was added (like mov \$0,%0), then you'd need to change the format as well. It is part of the standard encoding of the disassembly of the .com format (Sections 3.2-3.3). In that case it has a purpose, and you'd make sure to decode it that way. The decoder then strips it out if it doesn't match the expected format and would have otherwise mangled the instruction. To summarize: The instruction exists, it does have a purpose, you would not replace it with a NOP. Silvertold noted that the system is used throughout the occupied West Bank, but that such incidents are rare. He also said, "I am sure this incident will create a wave of Palestinian anger, and our security forces are preparing for a large-scale incident, as the settlers have been operating in the area for three years." In April 2011, Jewish settlers vandalized the same water system in the same village. While the water system is located on a hilltop, the cisterns are located in the river valley.
